

LORP Synopsis for August 2023

Compliance Comments

Flows were above the minimum flow for the month.

Maintenance

Activities for the month on the Lower Owens River included the following:

- Current metering continues the development of discharge curves at all in-river flow monitoring sites and are used to develop velocity indexing tables.
- Some in-river station measurements have fluctuated as a result of shifting and increased sedimentation in the river, requiring additional indexing to increase the accuracy of measurements.

Operations

With a 296% of normal Eastern Sierra Snow Pack and a projected Owens River Basin Runoff of 233% of normal, flows throughout the Los Angeles Aqueduct system were abnormally high, including inflows to the LORP. These high flows, at times, exceeded the regular measurement capacity of the LORP in-river stations. In order to accurately measure the high flows, the in-river stations were current metered daily. Metered flows were used as 24 hour average flows for each respective day.

Beginning in early May, LORP Intake flows were changed daily. Individual flow change memos were not issued for these daily flow changes.

On August 3, normal operation of scheduled flows resumed at LORP Intake. On August Impacts from Tropical Storm Hilary necessitated unscheduled flows at LORP Intake from August 21 through August 28. On August 29, normal operation of scheduled flows resumed at LORP Intake

On August 29, debris resulting from Tropical Storm Hilary became lodged in the Alabama Spillgates, preventing the gates from being closed.

Below are the flow changes during the month:

- LORP Intake flow to 125 cfs on August 3, 2023.
- LORP Intake flow from 125 cfs to 100 cfs on August 8, 2023.
- LORP Intake flow from 100 cfs to 90 cfs on August 10, 2023.
- Alabama Gates from 0 cfs to 100 cfs on August 20, 2023.
- Alabama Gates from 100 cfs to FULL OPEN on August 21, 2023.
- LORP Intake flow to 90 cfs on August 29, 2023.
- LORP Intake from 90 cfs to 50 cfs on August 31, 2023.

Waterfowl Area Monthly Report

Synopsis (for Runoff Year 2023-2024)

Implementation of the Interim Management and Monitoring Plan continued, which includes the seasonal flooding regime and a fixed waterfowl acreage goal of 500 acres.

On March 1, 2023 (RY 2022-23) flows to all units were set to 0 cfs.

Flow Rates and Wetted Acreage Summary (for Runoff Year 2023-24)

	Inflow (cfs)	Date Set	Wetted Acreage	Date of Survey
Drew Unit	off	4/16/2021		
Waggoner Unit	off	3/1/2023		
Winterton Unit	off	3/1/2023		
Thibaut Unit	off	3/1/2023		

AUGUST 2023 LORP CURRENT METERING SUMMARY

Date	LORP Stations			
	Intake	Mazourka Canyon Road	Reinhackle Springs	Pumpback Station*

FLOW CHANGE REQUEST/NOTIFICATION

ATTN: Ian Keller

DATE: August 4, 2023

REQUESTED BY: T. Tillemans x32259

FLOW CHANGE LOCATION **LORP Intake**

START DATE: Thursday, August 3, 2023 TIME: already occurred

CHANGE FLOW: To: 125 cfs

***** THIS FLOW CHANGE HAS ALREADY OCCURRED *****

To maintain required flows to the LORP, monitor and make adjustments to the Aqueduct Intake gates for at least one day following this flow change.

C: Adam Perez
Russell Pierson
Forest Mathieu
Ryan Yeager
Joe Bowling

Quality Assurance and Calibration Procedures

The Los Angeles Department of Water and Power has a set standard to assure quality of all hydrological data collected. Procedures used to QA data vary based on the type of data collected and the device used to measure flow.

Data collected from sites utilizing area velocity flow meters are electronically monitored continuously. Sites are physically visited most days of the week to assure debris or vandalism hasn't affected the reading. Errors in the data collected may arise from several sources:

1. The transducers which detect the stage height and velocities have a tendency to drift.
2. Power outages occur occasionally thereby preventing the recording of data to the data loggers.
3. Occasionally the data loggers themselves malfunction.
4. Data can be lost or corrupted when it is transferred from the data loggers to the laptop.

Errors in discharge can originate from the instability of the relationship between velocity and stage height. This relationship varies temporally. It is affected by changes in the streambed that results from the flow of water over the bed, such as scour and fill, aquatic growth, ice, debris, or bed roughness.

To compensate for changes in the constantly shifting conditions multiple current meter measurements at each location per USGS standards are conducted per month. The current meter shots are taken at 2 foot intervals horizontally across the lined sections or 1 foot intervals at the sites where the measurements are taken in culverts. In each vertical section two separate measurements are taken (0.2 and 0.8) of the depth to achieve the best velocity average in the vertical. These vertical discharges are then added together to obtain a total flow in the section. The current meter data is logged in an on-board computer tracking the measurements as taken. That data is then extracted from the on-board computer to a PC using the FlowPack software that allows analysis of the data for erroneous measurements and is then converted to an Excel spreadsheet for ease of storage and printing. See Examples 1 – 3 for printout of software used to validate the current meter data.

Current meter data is used to develop velocity index tables. The tables require a minimum of 6 meter shots. After a table has been developed it is then downloaded into the on-site SonTek software which takes into account any variables within the meter section and applies any shifts to the discharge.

Data is collected and logged every 10 minutes utilizing SonTek area velocity flow meters. The data is downloaded from the meters once per month utilizing software provided by SonTek. The software "ViewArgonaut" gives us the ability to check items relevant to the performance of the meter. Battery voltage, beam strength, noise ratios, depth, and cell distance. (See Example 4) The software provides a trend of the data collected and displays it for quick comparisons, flagging discrepancies, one day at a time. Utilizing the ViewArgonaut software monthly reports are generated and the data is

reviewed. Using the current meter data collected during the month shifts are applied to the discharge to assure accuracy.

Augmentation Flows

Flows at several of the augmentation points are measured using weirs and flumes at sites that were pre-existing. Billy Lake has a one foot Parshall flume, Locust and Georges Returns have three foot weirs installed. All have stilling wells with dataloggers installed. The water surface elevation in the stillwell is measured each time the site is visited and verified it matches the staff gage for correct water depth through the measuring device. The still wells are flushed once every two months to assure the communication line is open and free of debris. The gage height data is logged on a module every 15 minutes. The modules are changed and processed every two weeks. Software used to process the data gives an hourly average gage and converts it to flow. It also gives the maximum and minimum flows for each day and time stamps it. The data is reviewed for any discrepancies which can be caused as a result of debris plugging the measuring device, a plugged stillwell, low batteries, etc.

SonTek's FlowTracker

All the tools you need to work with the FlowTracker.

Select one of these actions:

-  [Open a FlowTracker file](#)
-  [Open many FlowTracker files/folders](#)
