

LORP Synopsis for April 2010

Compliance Comments:

Flows were well above the minimum flows for the month and there were no issues of non-compliance related to river flows.

Maintenance

Activities for the month of April on the Lower Owens River included the following:

- Current metering continues the development of discharge curves at all in-river flow monitoring sites and are used to develop velocity indexing tables. These tables are being updated bi-weekly and downloaded to the SonTek flowmeters monthly to aid in the calibration of the meters.
- Some in-river station measurements have fluctuated as a result of shifting and increased sedimentation in the river, requiring additional indexing to increase the accuracy of measurements.
- The stations with culverts continue to be cleaned since starting flows using high pressure hoses and brooms. The sediment continues to build up at various stations and seems to be an on-going issue.
- On April 1st, adjustments made to the upstream level transducer at the LORP Intake. Cleaning of sediment around transducer was also performed.
- Deployed Sontek S/W meter at new Reinhackle station.
- On April 9th, adjustments and cleaning at LORP Intake transducer location were performed again.
- Work on new Mazourka Canyon measuring station began.

Operations

Here are the flow changes during the month:

Langemann at Pump Station increased from 4 cfs to 25 cfs on April 20th, 2010.

Waggoner Waterfowl net inflow increased from 1.7 to 7.2 cfs on Apr 21st, 2010.

Drew Waterfowl inflow increased from 1.7 cfs to 6.6 cfs on April 21st, 2010.

Thibaut Pond inflow increased from 0.5 cfs to 1 cfs on April 21st, 2010.

Langemann at Pump Station decreased from 25 cfs to 7.5 cfs on April 30th, 2010.

Waterfowl Area Monthly Report

Synopsis (for Runoff Year 2009-10)

The wetted acreage goal for the 2009-2010 runoff year was 355 acres. The agreed upon plan calls for setting the flows in the waterfowl areas based on the historical history of each area. For the Drew and Waggoner Units, the first year flows were to be set based on the history of the Winterton area.

The timing of the first on flows were delayed due to the late adoption and modifications of the new Operation Procedures. Flows at the Drew and Waggoner Units should have been turned on to 4 cfs beginning on April 1 per the new agreement but were delayed somewhat as shown in the table below. On June 1st, the beginning of the “summer” period, the flows at both Drew and Waggoner were adjusted to account for the seasonal variation in evapo-transpiration.

The low wetted acreage observed in the Drew and Waggoner areas during May caused some concern and DWP investigated why the acreages were observed at such low levels given the flows applied to the waterfowl areas. From what DWP personnel were able to determine, both Drew and Waggoner continued to absorb water into the soil and didn't display much standing surface water through the end of May. Due to the low wetted acreage concern, the Winterton Unit was turned on again on June 1st to supplement the acreage until the Waggoner and Drew Units are fully wetted and finished with soaking up ground water.

From the measurements at the beginning of July, both Drew and Waggoner were observed to have rapidly expanded in standing water surface area. Due to the expanded acreages in these areas, the flows to Winterton were cut in half from 6 cfs to 3 cfs in the middle of month as DWP personnel continued to observe the expansion of Drew and Waggoner through the remainder of the month.

On August 16th, flows were adjusted for the fall ET season. Drew and Waggoner were set from 4.7 to 4.8 cfs and Winerton was turned off (going from 3 cfs to 0 cfs). The mid-august wetted acreage measurements totaled 392 acres, well above the goal of 355 acres.

The wetted acreage measurements taken in September and October showed slight gains in wetted acreage over the august measurements and on October 15th the flows into Drew and Waggoner were adjusted to 1.7 cfs for the winter season. During November and December no adjustments to inflows were made and no acreage reads were taken, but during January reads of Drew and Waggoner were taken and found to have slight gains over the October reads (Drew at 287 and Waggoner at 210 for a total of 497 acres). In mid spring, the last reads of the runoff year were taken and Drew was at 262 acres, while Waggoner was at 178 acres.

For the 2009-10 Runoff Year, Drew averaged 224 acres (mid-season reads, weighted by # days per season) and Waggoner average 161 acres for a total of 385 acres. This exceeded the goal of 355 acres.

Waterfowl Area Monthly Report

Synopsis (for Runoff Year 2010-11)

The Blackrock Waterfowl acreage goal for Runoff Year 2010-11 is 475 acres.

Taking into account water use, maximum capacities, and wildlife concerns DWP chose to maximize the Drew wetted acreage because it uses relatively less water than Waggoner and because it has displayed more diverse and robust wildlife. From observations during the 2009-10 runoff year, the best guess for the maximum capacity for the Drew Unit is between 290 and 300 acres before water levels reach the point where water starts spilling back into the Blackrock Return Ditch. Due to this, the flows to the Drew Unit will be set with a goal of 275 wetted acres. The remaining 200 acres will be achieved through the Waggoner Unit and flows there will be set with that goal in mind.

The preliminary waterfowl operation protocol calls for the previous ET-season flow vs. acreage ratios to be used in order to set new flows. However, the 2009 spring data is skewed to a very high inflow ratio due to the 'wetting up' period both Drew and Waggoner went through from mid April through mid August last year. As such, because the seasonal ET rates of spring and fall are usually similar, the ratios from the fall of 2009 were used instead of the artificially high ratios from the spring of 2009.

Beginning April 21st the new flows were set and based on the fall 2009 ratios, resulting in a 6.6 cfs inflow to the Drew Waterfowl Area and a 7.2 cfs net inflow to the Waggoner Waterfowl Area.

For the summer flows, the Drew and Waggoner areas were also still 'wetting up' for much of the summer, but not as drastically as it had been during the spring. In order to set the flows for summer 2010, the average acreage for middle and end of summer reads will be used to set the ratios (instead of using the middle only). Using the average of the two reads results in a 6.8 cfs net flow to Waggoner and a 8.1 cfs flow to Drew. However, these flows will not be set until the beginning of the ET-summer which begins on June 1st.

FLOW CHANGE REQUEST/NOTIFICATION

ATTN: Larry Benbrook

DATE: April 14, 2010

REQUESTED BY: Eric Tillemans x30256

FLOW CHANGE LOCATION **Langemann Gate at Pumpstation**

Increase flow at the LORPS Langemann Gate from 4-cfs to 25-cfs for an Owens Lake Delta pulse flow. This pulse flow will run for 10 days. If the Langemann Gate is not able to sustain the 25-cfs because of submergence, then manually adjust the pumps in order to maximize the upstream level for the Langemann Gate to avoid submergence. Northern District Hydrographic staff will be on site to assist.

START DATE: Tuesday April 20, 2010 TIME: 8 AM

CHANGE FLOW: FROM: 4-cfs TO: 25-cfs at LORPS Langemann

END DATE: Friday April 30, 2010 TIME: 8 AM

CHANGE FLOW: FROM: 25-cfs TO: 7.5-cfs at LORPS Langemann

Quality Assurance and Calibration Procedures

The Los Angeles Department of Water and Power has a set standard to assure quality of all hydrological data collected. Procedures used to QA data vary based on the type of data collected and the device used to measure flow.

Data collected from sites utilizing area velocity flow meters are electronically monitored continuously. Sites are physically visited most days of the week to assure debris or vandalism hasn't affected the reading. Errors in the data collected may arise from several sources:

1. The transducers which detect the stage height and velocities have a tendency to drift.
2. Power outages occur occasionally thereby preventing the recording of data to the data loggers.
3. Occasionally the data loggers themselves malfunction.
4. Data can be lost or corrupted when it is transferred from the data loggers to the laptop.

Errors in discharge can originate from the instability of the relationship between velocity and stage height. This relationship varies temporally. It is affected by changes in the streambed that results from the flow of water over the bed, such as scour and fill, aquatic growth, ice, debris, or bed roughness.

To compensate for changes in the constantly shifting conditions multiple current meter measurements at each location per USGS standards are conducted per month. The current meter shots are taken at 2 foot intervals horizontally across the lined sections or 1 foot intervals at the sites where the measurements are taken in culverts. In each vertical section two separate measurements are taken (0.2 and 0.8) of the depth to achieve the best velocity average in the vertical. These vertical discharges are then added together to obtain a total flow in the section. The current meter data is logged in an on-board computer tracking the measurements as taken. That data is then extracted from the on-board computer to a PC using the FlowPack software that allows analysis of the data for erroneous measurements and is then converted to an Excel spreadsheet for ease of storage and printing. See Examples 1 – 3 for printout of software used to validate the current meter data.

Current meter data is used to develop velocity index tables. The tables require a minimum of 6 meter shots. After a table has been developed it is then downloaded into the on-site SonTek software which takes into account any variables within the meter section and applies any shifts to the discharge.

Data is collected and logged every 10 minutes utilizing SonTek area velocity flow meters. The data is downloaded from the meters once per month utilizing software provided by SonTek. The software "ViewArgonaut" gives us the ability to check items relevant to the performance of the meter. Battery voltage, beam strength, noise ratios, depth, and cell distance. (See Example 4) The software provides a trend of the data collected and displays it for quick comparisons, flagging discrepancies, one day at a time. Utilizing the ViewArgonaut software monthly reports are generated and the data is

reviewed. Using the current meter data collected during the month shifts are applied to the discharge to assure accuracy.

Augmentation Flows

Flows at several of the augmentation points are measured using weirs and flumes at sites that were pre-existing. Billy Lake has a one foot Parshall flume, Locust and Georges Returns have three foot weirs installed. All have stilling wells with dataloggers installed. The water surface elevation in the stillwell is measured each time the site is visited and verified it matches the staff gage for correct water depth through the measuring device. The still wells are flushed once every two months to assure the communication line is open and free of debris. The gage height data is logged on a module every 15 minutes. The modules are changed and processed every two weeks. Software used to process the data gives an hourly average gage and converts it to flow. It also gives the maximum and minimum flows for each day and time stamps it. The data is reviewed for any discrepancies which can be caused as a result of debris plugging the measuring device, a plugged stillwell, low batteries, etc.
